

Build a business model that works.

Who pays, what for, how much, how often, and where it could break.

WHY THIS SESSION

A good idea is not a business until you know how it makes money.

WHAT TODAY GIVES YOU

By the end you can look at any idea, yours or one an AI hands you, and see how it actually makes money and where it could fall apart.

A business model is just how the money flows.

The full business model canvas has nine parts. The four about money are what we work today.

WHO PAYS

The person who actually opens their wallet. Not always the person who uses it.

WHAT FOR

The thing they are paying to get.

HOW MUCH

The price they pay each time.

HOW OFTEN

Once, every month, or every time they use it.

THE EXAMPLE WE WILL USE

Meet Tomás.

He is fifteen, learning guitar, and about to quit, because the scales bore him. An app turns those drills into the songs he wants to play, so he keeps going.

■ GUITAR PRACTICE APP

Tomás uses the app. His parents are the ones who pay.

USER

Tomás, 15.

He opens the app every day, but he has no money of his own.

TWO PEOPLE,
ONE APP

**The app has
to keep
Tomás
coming back,
and be worth
paying for to
his parents.**

PAYER

His parents.

They want him to stick with guitar, and they hold the money.

Almost every model is one of eight shapes.

Most ventures are just one or two of these. Guess the company before you read it.

SUBSCRIPTION Pay monthly to keep access. Netflix.	FREEMIUM Free for most, pay for extra. Spotify.	MARKETPLACE A cut of other people's sales. Airbnb.	TRANSACTION FEE A slice of each payment. App Store.
ONE-TIME Pay once, own it. Minecraft.	ADVERTISING Users free, advertisers pay. YouTube.	PAY-PER-USE Pay for what you use. Uber.	SPONSORSHIP Another business pays. Red Bull.

The four boxes, filled in for Tomás.

An AI can fill these boxes in seconds; telling whether they are right is the part that is yours.

WHO PAYS	WHAT FOR	HOW MUCH	HOW OFTEN
His parents.	A practice app he keeps opening.	€8.	Every month.

WHERE THE JUDGMENT IS

The payer is his parents, not Tomás, and the money comes monthly, because that is how parents budget. An AI fills the boxes, but those two calls are yours.

Every business model has a built-in trap.

SUBSCRIPTION

Why keep paying every month when a free version exists?

FREEMIUM

Everyone takes the free tier, and almost no one upgrades.

MARKETPLACE

Empty at the start, with no buyers and no sellers yet.

TOMÁS'S TRAP

His parents want follow-through, but Tomás wants to play, not drill. The day it feels like a chore he stops opening it, and they cancel.

Your price can be wrong, but it cannot be random.

Every price needs a reason. These are the three places a real one comes from.

OPTION A

A competitor's price.

What a similar product already charges for the same job.

OPTION B

Willingness to pay.

What a real person has told you they would pay.

OPTION C

Cost plus a margin.

What it costs you to serve one customer, plus a margin on top.

PUT IT IN ONE LINE

The four boxes become one sentence.

This sentence is not new work; it is your four boxes, said out loud.

Payer pays price per unit for value .

THIS IS YOUR CANVAS, IN ONE LINE

Every blank came straight from your four boxes, so the model and the sentence are the same thing said two ways. For Tomás: his parents pay €8 a month for an app he keeps opening.

Your turn.

You work on your own here, alongside the other business specialists, and bring it to your team at the end.

FILL

Your four boxes.

10 min

STRESS-TEST

Test the model.

20 min

LOCK IT IN

**Pull it into one model you
can defend.**

10 min

Fill your four boxes as a first pass.

List two or three patterns that could fit your idea. Then pick the best one.

WHO PAYS ---	WHAT FOR ---	HOW MUCH ---	HOW OFTEN ---
PATTERN Name two or three that fit, choose one, and know why it beats the others.			

Test the model in three moves.

- 01 Is the person who pays really the user, or is it someone else? If it is someone else, fix box one.
- 02 Find one real number your price can stand on, like a competitor's price or what someone told you they would pay.
- 03 What is the one thing that could make this model stop working? Write the trap in your own words.

END OF STAGE 2

Pull it into one model you can defend.

You wrote the pieces in Stage 2. Now say them as one line, the shape you used for Tomás.

Payer pays price per unit for value .

THIS IS WHAT YOU TAKE BACK

This one line is what your team takes out this afternoon, and the trap you named is the first thing you go and test on real payers.

READY TO TAKE TO YOUR TEAM

Say your model in four sentences.

Then your partner tries to break it. Their job is to find the trap, with three questions to throw at you.

- 01 Why wouldn't they just use the free version?
- 02 Is that price too high, or too low?
- 03 What if half your users never pay?

SWAP, THEN GO AGAIN

HUDSON LAB VENTURES

A model you can take to real payers, in one line.

1

PAYER NAMED

Checked against the user. They may not be the same.

€ _ _ _

PRICE DEFENDED

Backed by one real reference number.

!

THE TRAP NAMED

The weak point your model has to manage.

Now bring your model to your team and shape one plan together.

Two things you carry from here.

THIS AFTERNOON • OUT IN MARKET

Make a real payer prove it.

Do not ask friends if they like it. Ask real parents to put a little money down now, or compare your price to what they already pay for lessons. Money committed is the only real yes.

TOMORROW • B2

Turn the model into a margin.

Bring your one-line model and find the break-even, where the money has to work.
