

Find the math that adds up.

One move today: canvas thinking. Map who pays, what for, and what it costs. Before you build anything.

WHY BOTHER

A great product can still lose money.

A canvas tells you two things a feature list can't.

PROVE

Whether your math survives contact with reality.

PROBE

Where your biggest assumption is hiding.

MAP THE CANVAS

Six cells. Three answer WHO. Three answer HOW.

WORKED EXAMPLE

Maya's mom, 42. Three sleep subscriptions. Two forgotten.

MAP HER ONTO SIX CELLS

02 PROBLEM

03 VALUE

04 CHANNEL

05 REVENUE

06 COST

CUSTOMER

Who wants. Who pays.

01

Maya asks. Mom approves.

WHERE THE BUSINESS LIVES HERE

The user and the customer are different people.

REVIEW SUNDAY 09:14

€14.97

02

Mom sees the charges. Two she'd forgotten existed.

WHERE THE MATH LIVES HERE

Be the line she keeps.

COST

03

What It Actually Costs.

Servers, content, support, refunds.

WHERE THE MATH BREAKS HERE

Per-user costs always grow until you measure them.

The Tell

**The User Wants.
The Customer Decides.**

FILL THE CANVAS, THEN STAR THE ASSUMPTION

CUSTOMER				
€14.97 · Mom keeps two.				
PROBLEM	VALUE	CHANNEL	REVENUE	COST
				?? haven't tested

THE PAYOFF

It's not the product. It's the line Mom keeps.

WHAT THE CANVAS IS REALLY FOR

**The canvas isn't a list.
It's how you find your weakest bet.**

Fill every cell, mark the one that decides the business, then test that one first.

KITCHEN SINK

Every cell stuffed equally. No priority. No bet.

WISHFUL PRICING

Price you hope for, not the price they pay.

FILL THE BLANKS, DON'T FREE-WRITE

{Customer} pays {price} for {value}, found via {channel}.
Until {evidence}, we won't bet on {assumption}.

YOUR RISKIEST CELL

The {assumption}. That's the one cell to test first. The rest can wait.

FAILS

Maya pays €4.99 for sleep. Vague customer, no payer logic.

WORKS

Maya's mom pays €4.99 for fewer arguments, found via school newsletter.

ONE CANVAS, BUILT IN STAGES

Your turn.

We do the customer cell together, then your team runs each stage. We float, we do not fill it in.

STAGE A

Fill the canvas

6 cells, sorted

STAGE B

Star the bet

one cell

STAGE C

Stress the math

math sentence

STAGE D

Translate

lean plan

STAGE A / ~20 MIN

Fill the canvas.

Six cells. Sort them by how confident you are. Honesty wins over speed.

2

KNOW

You can defend the answer out loud.

2

GUESS

You have an opinion but no evidence.

2

DON'T KNOW

Write the question, not a guess.

Checkpoint: 6 cells filled, each tagged know / guess / don't.

STAGE B / ~15 MIN

Star the bet.

Stand back for perspective. Which cell decides whether you have a business?

PLACE

Read the canvas out loud. Say what each cell means in plain words.

READ

Where is your weakest answer? Where would a no-vote sink everything?

STAR

Mark the one. Not a decision. A bet you would defend.

Checkpoint: one starred cell, one sentence why.

STAGE C / ~10 MIN

Stress the math.

WRITE YOUR CANVAS SENTENCE

{Customer} pays {price} for {value}, found via {channel}.
Until {evidence}, we won't bet on {assumption}.

Now sort every other cell: KNOW / GUESS / DON'T KNOW. The don't-know pile is your test list.

Checkpoint: one canvas sentence, one assumption you would test first.

BY 16:00, EVERY TEAM HAS

Cells Filled, Each Tagged

1

Starred Bet That Decides the Business

1+1

Canvas Sentence and One Assumption To Test

A GOOD CANVAS

Honest about what's known vs guessed. The bet is real.

A LAZY CANVAS

All cells equally confident. No bet. Sentence reads we sell to everyone.

TWO THINGS HAPPEN NEXT

Where your canvas goes next.

REALITY CHECK / WED PM

Out in Market. Take your starred assumption to real people. Find validation outside and not the whiteboard.

TRANSLATE / PAPER FIRST

Your canvas becomes the business heart of the lean product plan: the customer, math & bet.
